

HEALTHCONNECT EXPERIENCE LAB

Final Integration Readiness & Cross-Track Evidence

Week 7 → Week 8 Transition | Data Analytics

Project Information	Details
Author	Nancy Lee YIMBERE ALAPINI
Track	Data Analytics
Positioning	Performance & Decision Intelligence Analyst
Programme	AnalystLab Africa — Premium Data Analytics Internship
Project	HealthConnect Clinic Experience Lab
Purpose	Document final Analytics readiness, cross-track integration evidence, dependencies, limitations and the Week 7 → Week 8 transition.
Document status	FINAL WEEK 8 EVIDENCE DOCUMENT

EVIDENCE RULE: completed collaboration is claimed only where an actual exchange, use of outputs and resulting change are evidenced.

1. Concise Week 7 → Week 8 Transition

Week 8 transition requirement	Final Data Analytics position
Main Week 7 output	A tested and refined Analytics decision-support solution with a validated three-page dashboard: MONITOR → DIAGNOSE → PRIORITIZE.
Most important testing result	Booking Lead Time remained the strongest standalone differentiation of No-Show behaviour: 39.13% NSR at 0–30 days vs 63.95% at 31–60 days (+24.82pp).
Major issue discovered	Interactive subgroup filtering could coexist with static global conclusions, creating a genuine interpretation risk.
Refinement made	MONITOR was retained as the interactive operational view; DIAGNOSE and PRIORITIZE were clarified as validated reference/decision-support views. Recommendation logic was strengthened with an explicit evaluation cycle.
Component now ready	Validated KPIs, evidence hierarchy, dashboard architecture, business insights, recommendations and Data Analytics × Data Science interpretation.
Still to integrate/document	Final Week 8 documentation and presentation materials; PM feedback was requested for HC-POD integration but was not received before finalisation.
Tracks involved	Data Science — completed Week 7 cross-track testing; Project Management — Week 8 integration request initiated and documented.
Final presentation objective	Show how validated Analytics identifies priority no-show patterns, supports targeted evaluation of attendance-support actions, and contributes to the wider HealthConnect solution without causal or deterministic overclaiming.

2. Final Integration Readiness

Readiness requirement	Final response
What is my final component?	HealthConnect Final Analytics & Decision Support contribution: validated KPI framework, evidence hierarchy, three-page Power BI dashboard, business insights, recommendations and evaluation logic.
What problem does it address?	It supports HealthConnect in identifying where to begin evaluating attendance-support actions for missed appointments and how to monitor the result.
What is its current status?	FINAL for the Data Analytics workstream; validated Week 7 evidence carried forward into Week 8.
What did I improve during Week 7?	Revalidated KPIs and findings; tested filter behaviour and interpretation; refined dashboard page roles; strengthened recommendations; completed controlled Data Analytics × Data Science testing.
Which other tracks does it depend on?	No unresolved Week 7 Analytics → Data Science testing dependency remains. Week 8 project-level integration expected coordination with Project Management.
Which tracks depend on my output?	Data Science used validated Analytics findings for feature-testing decisions.

	Project Management was provided with the Analytics handoff for final project integration and presentation coordination.
What output will I provide?	Final Analytics report, final validated dashboard/PBIX, validated findings, recommendations, limitations, cross-track evidence and presentation materials.
What output do I need from another track?	From Project Management: planned HC-POD walkthrough structure, expected Analytics positioning, relevant findings/visuals for project decisions, and any additional integration needs. No PM response was received before finalisation.
What evidence demonstrates readiness?	Week 7 Testing & Refinement Report; Project Summary; Testing & Validation Evidence Pack; DA × DS cross-track evidence; final PBIX/dashboard; PM handoff document; HC-POD 01 and direct-message integration requests.
What limitations remain?	Observational design; limited longitudinal patient-history reliability; some missing Distance/Waiting values; sparse extreme segments; intervention effectiveness not established; editable-dashboard governance; PM feedback not received before finalisation.

READINESS STATUS: DATA ANALYTICS FINAL AND READY FOR WEEK 8 SUBMISSION. COMPLETE HC-POD / PM INTEGRATION IS NOT CLAIMED WITHOUT SUPPORTING EVIDENCE.

3. Mandatory Cross-Track Integration Evidence — Data Analytics × Data Science

Required element	Documented evidence
1. Track collaborated with	Data Science — HC-POD 01.
2. Dependency	Analytics needed controlled testing of whether findings influencing model features added measurable out-of-sample predictive value.
3. Output received	Data Science returned controlled with-vs-without ablation results, bootstrap confidence intervals, grouped 5-fold cross-validation and business-lift evidence.
4. Output provided	Validated Analytics evidence on Booking Lead Time, Recorded Previous No-Shows, Distance to Clinic and Lead Time × Appointment Type, plus explicit tests requested for long_lead_followup and distance_to_clinic_km.
5. Final integration activity	Analytics findings were converted into explicit modelling questions and tested under the same Logistic Regression pipeline and patient-grouped validation.
6. What changed	long_lead_followup was removed; distance_to_clinic_km was retained in the candidate model.
7. How the change improved the solution	The feature set became simpler and more defensible; Distance retention became evidence-based; Analytics and predictive-model interpretations were explicitly separated.
8. Evidence	Week 7 HC-POD Cross-Track Testing & Validation Evidence; DA–DS validation evidence; Week 7 Analytics report/project summary; supporting Data Science validation notebook referenced in the evidence pack.
9. Contribution to final presentation	Demonstrates that cross-track testing changed real modelling decisions and supports the distinction: standalone analytical differentiation ≠ multivariable predictive contribution ≠ causality.

STATUS: COMPLETED | TESTED | REFINED | RETESTED | VALIDATED

4. Week 8 Integration Evidence — Data Analytics → Project Management

The Week 8 brief expected Project Management to coordinate final integration, dependencies, presentation sequence and project readiness. Data Analytics therefore initiated an integration request and supplied a structured handoff. The evidence supports the initiation and provision of Analytics outputs; it does not support a claim that PM collaboration was completed.

Required element	Documented status / evidence
1. Track concerned	Project Management — HC-POD 01 / Project Manager–Pod Lead.
2. Dependency	Project-level coordination was required for the final HC-POD walkthrough, Analytics positioning in the presentation, project decisions/dependencies and final integration sequencing.
3. Output received	None received from Project Management before finalisation.
4. Output provided	Formal HealthConnect Data Analytics Handoff to Project Management containing validated KPIs, no-show findings, dashboard roles, recommended decisions, DA × DS collaboration evidence and analytical limitations.
5. Final integration activity	Nancy initiated the Week 8 integration request in the official HC-POD 01 channel, contacted the PM directly, sent the formal handoff in DM, and requested the planned walkthrough structure, expected Analytics role, useful findings/visuals and any additional integration needs.
6. What changed	No PM-driven change can be evidenced because no PM response/output was received before finalisation. Analytics therefore retained the validated Week 7 evidence base.
7. How this affected the solution	The Analytics component could be finalised independently with its validated guardrails preserved, but complete PM/HC-POD integration cannot be claimed as validated.
8. Evidence	Official HC-POD 01 message; direct message to the PM; formal Data Analytics → Project Management handoff document. These show the request, material offered/provided and input requested.
9. Contribution to final presentation	Analytics presentation materials are prepared from the validated evidence base.

No PM-approved presentation structure or PM-provided project decision is attributed or inferred.
--

STATUS: INTEGRATION INITIATED AND DOCUMENTED PM FEEDBACK NOT RECEIVED BEFORE FINALISATION
--

5. Evidence Register

Evidence item	What it proves
Week 7 Analytics Testing & Refinement Report	KPI revalidation, evidence hierarchy, dashboard testing/refinement, recommendations, limitations and Week 8 readiness.
Week 7 Project Summary	Final Week 7 decisions, status and concise readiness position.
Week 7 Testing & Validation Evidence Pack	Detailed Analytics test-level evidence and reconciliation.
Week 7 DA × DS / HC-POD Cross-Track Evidence	Actual exchange, controlled testing, feature decisions and resulting solution improvement.
Final Week 7 / Week 8 Analytics Dashboard PBIX	Validated MONITOR → DIAGNOSE → PRIORITIZE decision-support component.
Data Analytics → Project Management Handoff	Formal Analytics output provided for Week 8 project integration; PM inputs explicitly requested.
HC-POD 01 message	Official channel evidence that the PM was tagged, collaboration was requested, Analytics outputs were offered, integration questions were raised, and the DM handoff was disclosed.
Direct message to Project Manager	Direct integration request and transmission of the handoff document.

6. Final Limitations and Boundary of Claim

- The Analytics findings are observational and do not establish causal intervention effectiveness.
- Group-level differentiation must not be presented as deterministic individual patient prediction.
- Recorded patient-history interpretation is limited by patient-level consistency; some Distance and Waiting Time values are missing and extreme segments are sparse.
- No financial impact is claimed without documented cost/revenue assumptions.
- Data Analytics × Data Science collaboration is completed and evidenced.
- Data Analytics → Project Management integration was initiated and documented, but no PM response/output was received before finalisation.
- Therefore, the Data Analytics component can be declared final; complete HC-POD integration or PM validation cannot be claimed on the available evidence.

7. Final Readiness Conclusion

The Data Analytics workstream is ready for Week 8 submission. Its final component is grounded in the validated Week 7 evidence base, its dashboard and decision-support logic have been tested and refined, and its Data Analytics × Data Science collaboration produced documented changes to the candidate feature set. Week 8 Project Management integration was actively initiated through the official HC-POD channel, direct contact and a formal Analytics handoff. Because no PM feedback was received before finalisation, no PM decision, validation or completed project-level integration is inferred. This unresolved coordination point is documented transparently and does not reopen the validated Analytics work.

FINAL STATUS: DATA ANALYTICS READY DA × DS COMPLETED DA → PM ATTEMPT DOCUMENTED, NO RESPONSE RECEIVED
